Examiner Amendment

An examiner's amendment to the record appears below. Should the changes and/or

additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR

1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the

payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with

Michael Byorick on 1/15/09.

Amendment to the following claims:

As per claim 1:

1.   A method for detecting computational errors in <u>a system comprising</u> a digital processor

executing a program, the method comprising steps of:

separating the program in computation segments;

compiling source code for at least one of the segments to generate two code sections, one

of which is functionally redundant with respect to the other; <u>and</u>

generating comparison code for comparing results produced by execution of the two code

sections;

<u>wherein the processor is configured to:</u> ~~executing~~ execute each of the code sections in a

different computational domain to generate respective results; ~~comparing~~ compare the respective

results using the comparison code <u>to detect said computational errors</u>; and ~~executing~~ execute one

of the code sections to alter further flow of execution of the program only if the respective results

are identical.

As per claim 18:

18.   A system for detecting computational errors in a digital processor executing a program,

the system comprising a compiler <u>executing on a processor</u> configured to:

  separate the program into computation segments;

  compile source code for at least one of the computation segments to generate output

comprising two redundant code sections, each of which is configured to execute in a different

computational domain; and generate comparison code for

  comparing respective results produced by execution of the two code sections; ~~and~~

  <u>indicate that one of said computational errors has been detected when the respective</u>

<u>results are different</u>.

As per claim 31:

31.   A system for detecting computational errors in a digital processor executing a program,

the system comprising;

  means for compiling source code for at least part of the program to generate two code

sections, one of which is functionally redundant with respect to the other;

  means for generating comparison code for comparing results produced by execution of

the two code sections; wherein each of the code sections is executed <u>by the processor</u> in a

different computational domain to generate respective results;

  means for comparing the respective results using the comparison code <u>to detect said</u>

<u>computational errors</u>; and

means for performing error handling, if a discrepancy between the respective results is

found.

As per claim 34:

34.   Computer product code ~~A software product~~ in a system comprising instructions,

stored on a computer-readable <u>storage</u> media, wherein the instructions, when executed by a

~~computer~~ <u>digital processor</u>, perform steps for detecting computational errors in a the digital

processor executing a program, comprising:

compiling source code for at least part of the program to generate two code sections, one

of which is functionally redundant with respect to the other;

generating comparison code for comparing results produced by execution of the two

code sections;

<u>wherein the processor is configured to:</u> ~~executing~~ <u>execute</u> each of the code sections in a

different computational domain to generate respective results; ~~comparing~~ <u>compare</u> the

respective results using the comparison code <u>to detect said computational errors</u>; an ~~performing~~

<u>perform</u> error handling, if a discrepancy between the respective results is found.

Response to Arguments

1.   Applicant's argument filed on 10/22/08 has been fully considered and they are found

persuasive.

Reasons for allowance

2.   Claims **1-36** are allowable over the prior art. The following is an Examiner's statement of

reasons for the indication of allowable subject matter: the prior art is exemplified by Bunnel et

al. (U.S. Patent No. 5,594,903) and Galpin (U.S. Patent No. 7,043,728).

As per claim 1:

Bunnel et al. teaches within a memory portion an executable image of the operating

system. The operating system is next to an interrupt vector table, wherein dynamic execution

support of the operating system is provided by virtual memory page address translation tables.

Further, an operating system boot loader is positioned within the memory at a default address.

The boot leader loads the operating system from a storage medium, wherein the storage medium

is ROM. Further, the boot loader program transfers execution of control over the (CPU) to a

predefined operating system execution entry point.

Galpin teaches executing a first sequence of instructions in a fixed process or thread and

executing a second sequence of instructions in a second process. The processes can operate in

different processors. Further, the states of the first and second processors are compared. The

states can include registers, memory and flags just to name a few, in order to see if the two

processes executed their respective sequences substantially identically, and are ready to begin

execution of additional sequences.

However, the two references mentioned above whether alone or in combination do not

teach *"compiling source code for at least one of the segments to generate two code sections, one*

of which is functionally redundant with respect to the other; execute each of the code sections in

a different computational domain to generate respective results; compare the respective results

using the comparison code to detect said computational errors; and execute one of the code

sections to alter further flow of execution of the program only if the respective results are

identical.

Dependent claims **2-17** depend from allowable independent claim and inherently include

limitations therein and therefore are allowed as well.

Independent claims **18, 31 and 34** are also allowable for having similar limitations to

claim

Dependent claims 19-30, 32-33 and 35-36 depend from allowable independent claim and

inherently include limitations therein and therefore are allowed as well.

Conclusion

3.   Any comments considered necessary by applicant must be submitted no later than the

payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for

Allowance."

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Enam Ahmed whose telephone number is 571-270-1729. The

examiner can normally be reached on Mon-Fri from 8:30 A.M. to 5:30 P.M.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Jacques Louis-Jacques, can be reached on 571-272-6962.

The fax phone number for the organization where this application or proceeding is

assigned is 571-273-8300.
